Using MH Utilities from Other Programs

Call as you would call other UNIX user utilites.

Shell script example that shows how to avoid changing user's current folder, message, etc.:

```
profile=/tmp/prf$$ context=/tmp/ctx$$
# Build temp MH profile to make sequences private:
echo "mh-sequences:" > $profile
cat ${MH-$HOME/.mh_profile} >> $profile
# Set environment variables to make MH use new files
# (context file will be created by first MH command):
MH=$profile MHCONTEXT=$context
export MH MHCONTEXT
# Now safe to change folder and current message:
scan -format '%(msg) %{from}' +outbox | ...
```
