Automate Handling of Incoming Mail

Automatically handle each incoming message:

- file (to folder),
- distribute (to other users),
- notify (on your terminal),
- discard,
- run any program (standard UNIX or your own)

Uses *slocal* utility and *.maildelivery* config file:

```
from    flamer@xyz    destroy  A  -
subject "vax digest" qpipe    A  "rcvstore +vax"
default -             file     ?  msgbox
```

Not very elegant or flexible. Other utilities (like *procmail*) are better.
